EDUCATION

Inderprastha Engineering College (Under AKTU), Ghaziabad, U.P. Bachelor of Technology in Computer Science Engineering	2020-2024
St. Angels School, Sector-15, Rohini, New Delhi, India Senior Secondary School (XII – CBSE) Senior Secondary School (X – CBSE)	2019-2020 2017-2018

SKILLS

Languages: Python | SQL | SAS
Data & Analytics: Machine Learning | Statistical Analysis & Comparison | Deep Learning (NLP, Computer Vision, LLMs)
Tools and Framework: AWS – Athena, SageMaker, Bedrock, EC2 | Power BI | Git and GitHub | Flask | Selenium | Microsoft Office

EXPERIENCE

- Data Analyst at Ameriprise Financial**

May (2024) – Present

APWG Client Prioritization & Retention Dashboard

 - Problem** – Advisor attrition in Ameriprise led to loss of high-value clients and AUM, as departing advisors moved clients to competitor firms. The business APWG lacked a unified view of client profiles and actionable insights to enable timely reassignment and retention.
 - Solution** – Developed an interactive Power BI Dashboard providing a consolidated view of clients linked to termed advisors.
 - Integrated key metrics including AUM Segmentation, portfolio distribution, growth trends, product enrollment, demographic details, engagement activity.
 - Enabled client prioritization and generated contextual “calling summaries” to support retention conversations & reassignment.
 - Impact** – Improved visibility into high-value clients & accelerated reassignment process for APWG. Enabled data-driven prioritization, enhanced retention efforts and reduced potential AUM loss.

Advice Insights Deletion Analysis using LLM

 - Problem** – In the Advice Insights tool, advisors frequently deleted client insight notifications and provided unstructured comments. The business lacked visibility into the reasons behind these deletions, making it difficult to improve the relevance and effectiveness of insights.
 - Solution** – Designed an LLM-based framework using Claude to analyze advisor comments. Performed sentiment analysis to categorize reasons for insight deletions across different insight types, transforming unstructured feedback into actionable insights.
 - Impact** – Provided clear visibility into advisor behaviour and key drivers of insight deletions, enabling optimization of the Advice Insights tool. Automated a previously manual analysis process, saving 5+ hours per month and improving overall efficiency.

Practice Segmentation

 - Problem** – Business wants to segment practices (advisor’s team) based on performance, to improve overall advisor productivity.
 - Solution** – Developed a clustering-based segmentation framework using K-Means, Agglomerative Clustering (with Gower distance), and K-Prototypes to handle mixed data types. Performed EDA to identify key features and optimized cluster formation using silhouette score for evaluation. Generated actionable segments to distinguish high- and low-performing advisors.
 - Impact** – Enabled the business to design targeted events and pairing strategies for different segments.

GenAI driven Financial Plan Evaluator

 - Problem** – Annual financial plans created by advisors were manually reviewed by supervision teams to ensure regulatory compliance, client-goal alignment, and fee justification—resulting in high operational cost, long turnaround times, and review inconsistency at scale.
 - Solution** – Built an automated compliance review system leveraging AWS Bedrock (Claude LLMs) to evaluate financial plans against regulatory, coverage, and quality criteria, including completeness of financial fundamentals, plan quality, and advisor fee justification.
 - Implemented LLM-based semantic similarity and change-detection to identify near-duplicate plans across multiple years, addressing low-value plan refreshes and improving advisor accountability.
 - Combined rule-based validations with LLM-powered reasoning to detect material changes across multi-year plans, improving precision while retaining explainability and audit defensibility
 - Impact** - Reduced reliance on manual supervision and saved 100K+ hours annually, enabling scalable, consistent, and regulator-ready plan reviews.
- Machine Learning Intern at IIT Delhi**

May- September (2023)

 - Worked with live solar power sensor data for the Power output of a solar panel.
 - Performed **data cleaning, preprocessing**, and **EDA** to identify key patterns. Experimented with multiple deep learning models including Simple NN, RNNs, and LSTMs to evaluate performance
 - Deployed the final model using **Flask**.

PROJECTS

Virtual Lawyer - Developed a Lawyer Consultant Chatbot utilizing the **LLAMA** (Large Language Model Meta AI) framework, coupled with a user-centric Chainlit frontend. The chatbot was fine-tuned using Retrieval-Augmented Generation (**RAG**) on a custom dataset comprising Indian legal data, which was systematically acquired through Selenium web scraping. This approach ensures highly contextual, tailored responses, enhancing user engagement and informative user experience.

- **Tech Stack:** Chainlit, Python, Generative AI, Natural Language Processing

PUBLICATIONS

Title - Automated Static Malware Analysis Using Machine Learning - **Bhawit Balodi**, Srijan Sharma, Anil Kumar Shukla, Bhupendra Singh
Published in: [10th International Conference on Signal Processing and Integrated Networks \(SPIN\)](#)

ACHIEVEMENTS

- Awarded with **GOLD PASS** for Leadership skills and self-starter capabilities in Coding Ninjas.
- 1st** Position in College Badminton Competition and **8th** overall rank in CBSE Inter School Badminton Competition.
